# Requirements management overview

## Jira products overview

### Jira Software

Plan, track and release world-class software.

### Jira Service Desk

Give your customers an easy way to ask for help and your agents a faster way to deliver it.

### Jira Core

Manage any business project including marketing campaigns, HR onboarding, approvals and legal document reviews.

### Jira Ops

Gain more control, faster response, and less interruption during major incidents.

A key function of requirements management is to establish a **common understanding** between the customer and the project team. This understanding forms the basis for planning and managing both the project and the final product. **Poor requirements management is a leading cause of project failure**, and there is little evidence to suggest that things are different in an agile world. **Agile emphasizes improving collaboration and understanding between the project team and the customer**, which implies that requirements are actually more, not less, important in an agile world.

Requirements management benefits:

1. **Collaboration**: Multiple people in different locations can work on the same information at the same time. This shortens review cycles and improves collaboration even when different time-zones are involved.

A key function of requirements management is to establish a **common understanding** between the customer and the project team. This understanding forms the basis for planning and managing both the project and the final product. **Poor requirements management is a leading cause of project failure**, and there is little evidence to suggest that things are different in an agile world. **Agile emphasizes improving collaboration and understanding between the project team and the customer**, which implies that requirements are actually more, not less, important in an agile world.

Requirements management benefits:

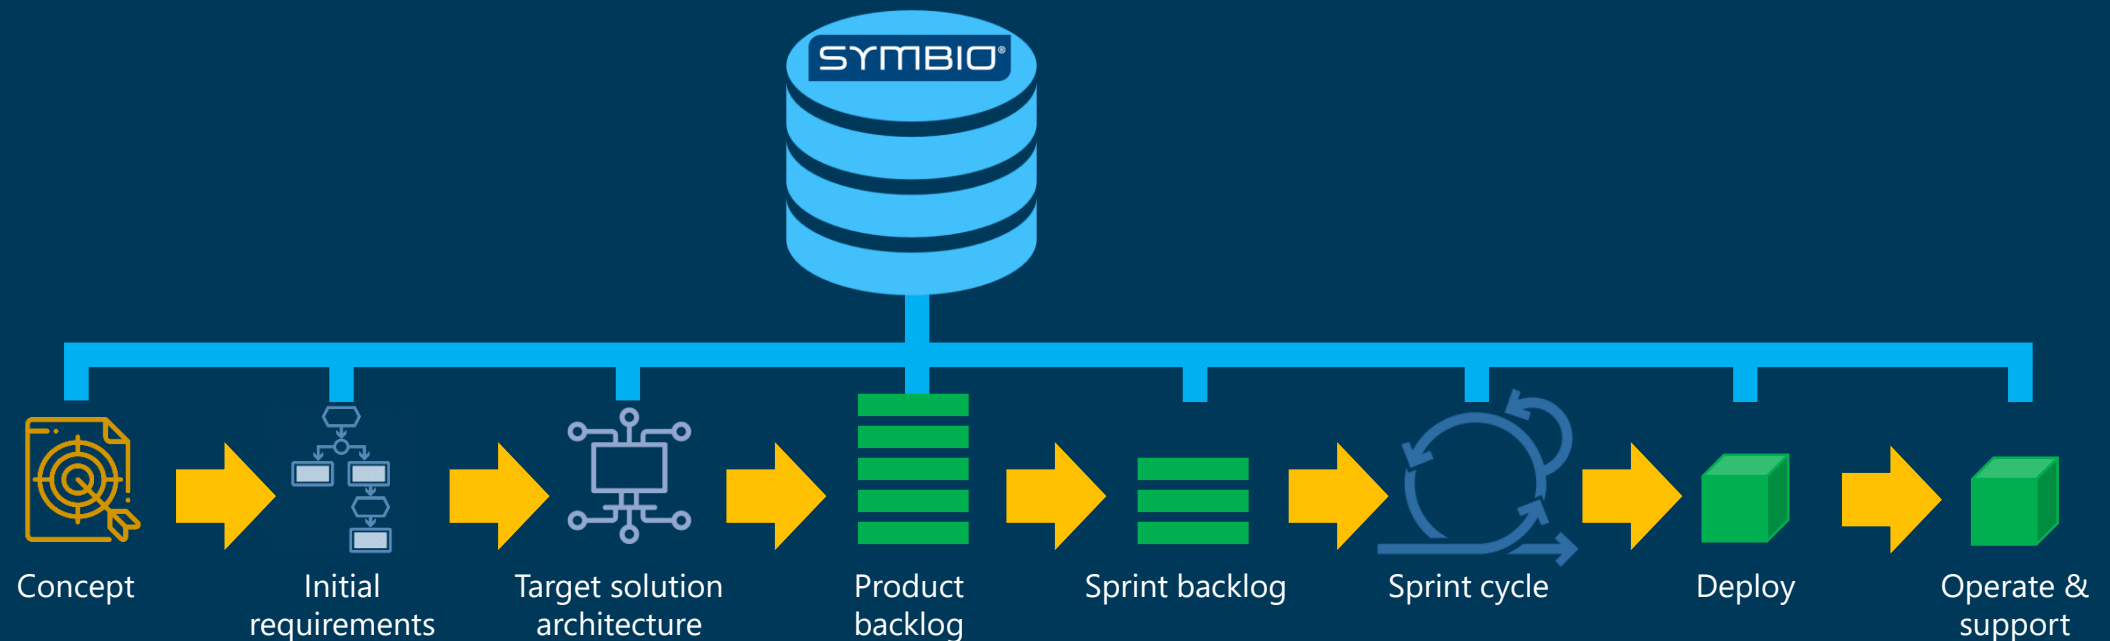

2. **Trusted (release management)**: The central requirements repository acts as a single source of truth, keeping large and diverse teams synchronized throughout projects. Consolidation, monitoring and analysis are quicker and information is consistent and accurate.

A key function of requirements management is to establish a **common understanding** between the customer and the project team. This understanding forms the basis for planning and managing both the project and the final product. **Poor requirements management is a leading cause of project failure**, and there is little evidence to suggest that things are different in an agile world. **Agile emphasizes improving collaboration and understanding between the project team and the customer**, which implies that requirements are actually more, not less, important in an agile world.

Requirements management benefits:

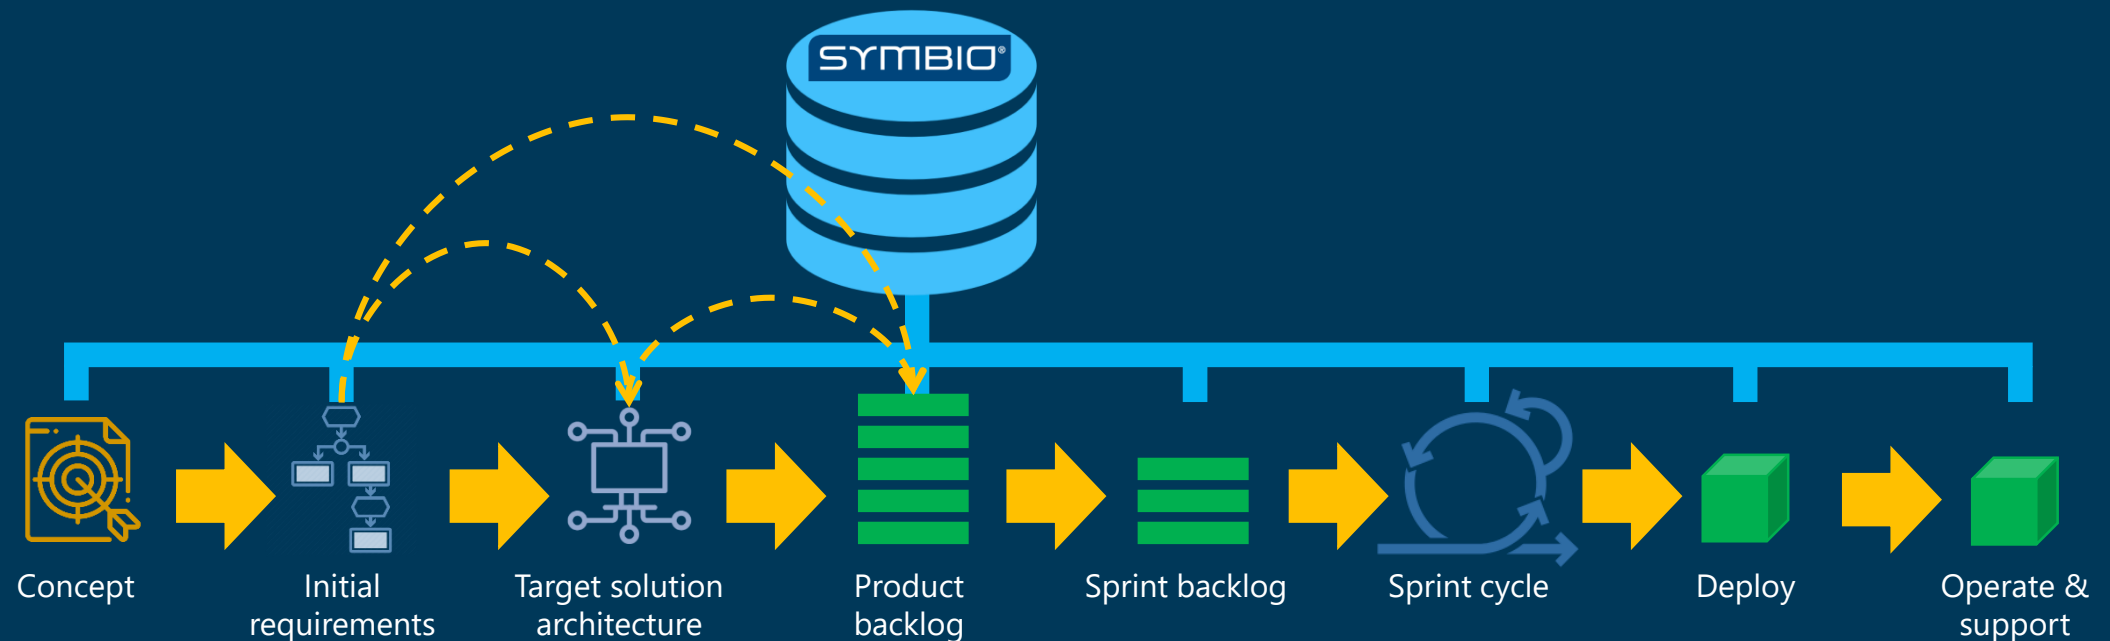

3. **Traceability**: Relationships can be created and maintained across the development lifecycle. This includes relationships between requirements, work items, architecture, design and test plans.

A key function of requirements management is to establish a **common understanding** between the customer and the project team. This understanding forms the basis for planning and managing both the project and the final product. **Poor requirements management is a leading cause of project failure**, and there is little evidence to suggest that things are different in an agile world. **Agile emphasizes improving collaboration and understanding between the project team and the customer**, which implies that requirements are actually more, not less, important in an agile world.

Requirements management benefits:

4. **Understanding change**: Change is inevitable in any project. Traceability analysis helps ensure that the impact of change is understood, and that impacted areas can be modified as necessary.

A key function of requirements management is to establish a **common understanding** between the customer and the project team. This understanding forms the basis for planning and managing both the project and the final product. **Poor requirements management is a leading cause of project failure**, and there is little evidence to suggest that things are different in an agile world. **Agile emphasizes improving collaboration and understanding between the project team and the customer**, which implies that requirements are actually more, not less, important in an agile world.

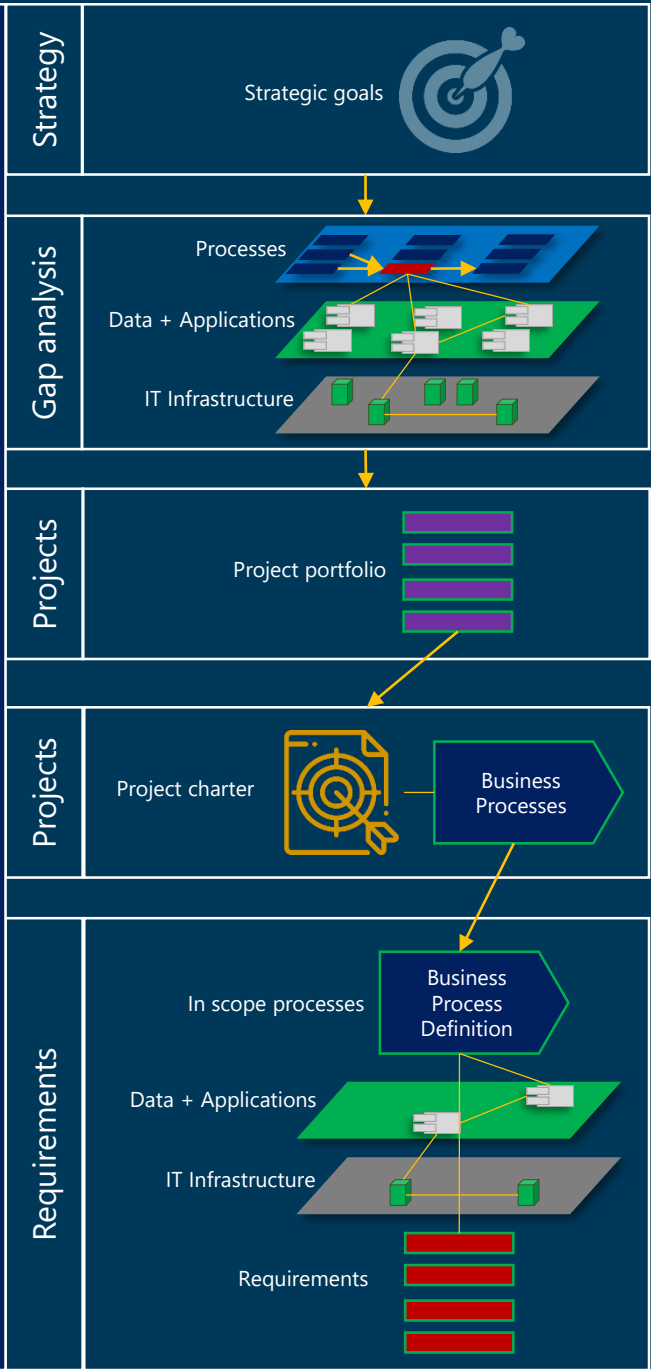

Requirements management benefits:

5. **Making your data work for you:** Dynamic views can be generated that meet stakeholder needs such as compliance, gap analysis, cost or test status. The overhead of manual information gathering and report building is eliminated, freeing team members to focus on creative work.

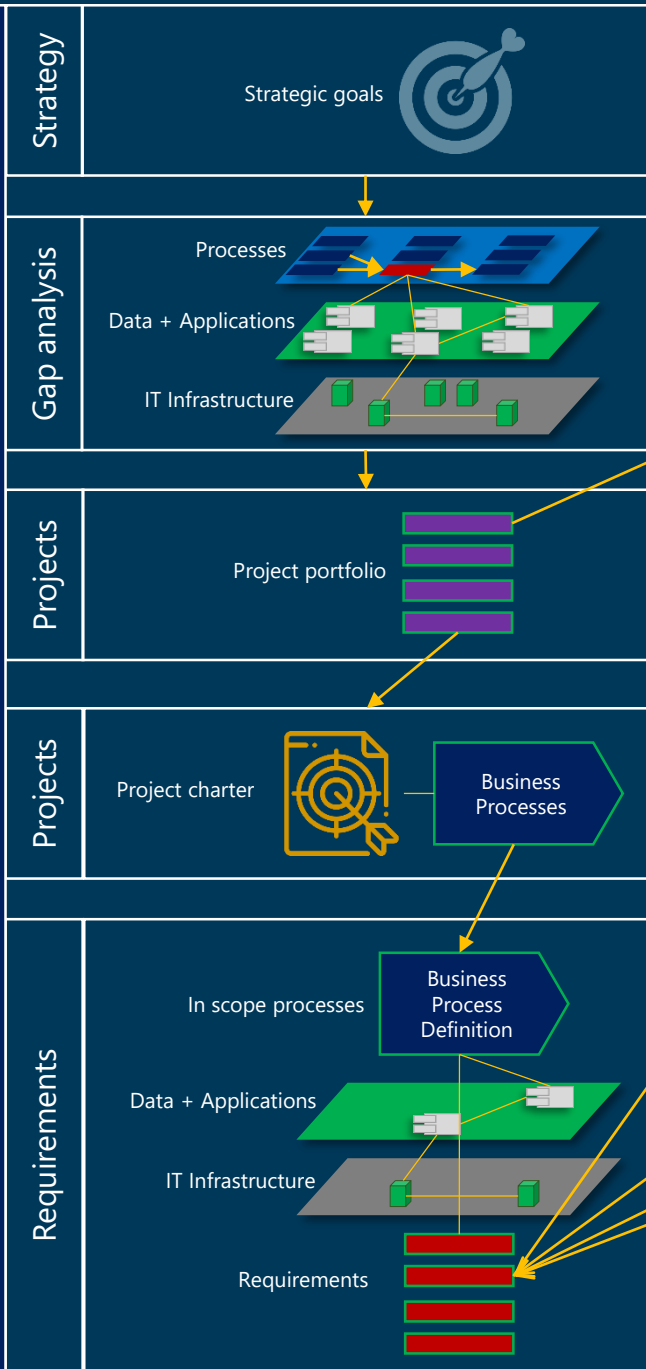

# Solution overview

Symbio user

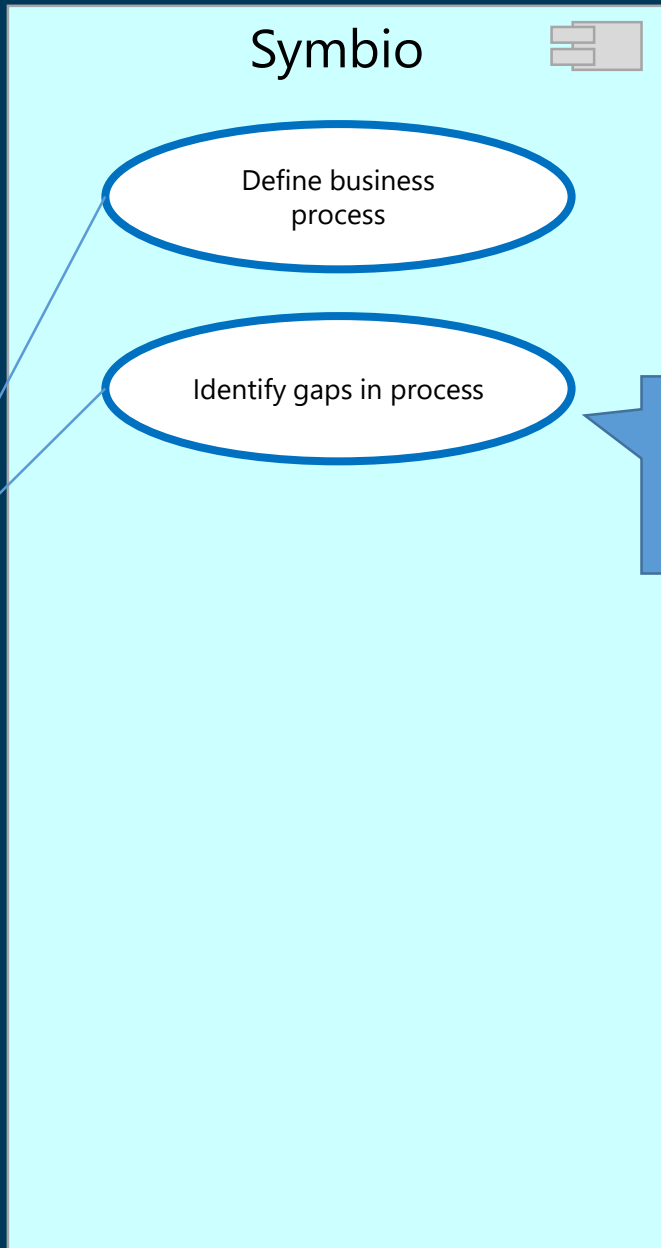

Model business process  
in Symbio

# Solution overview

Symbio user

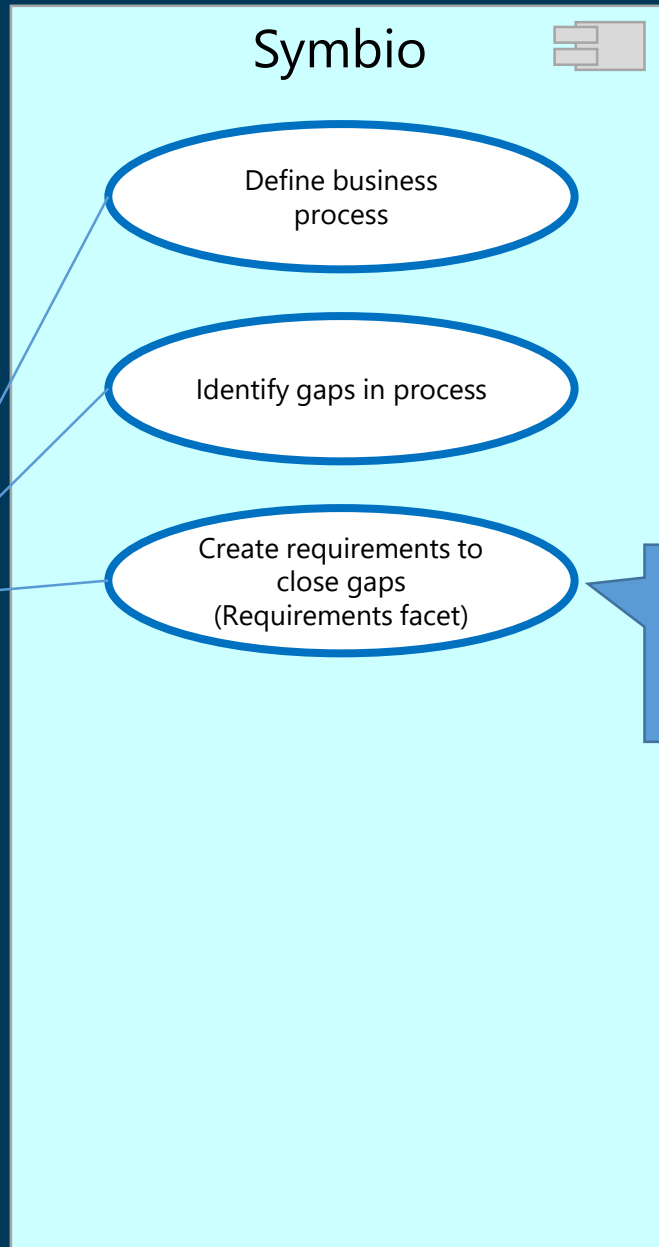

Identify gaps in the process (people, process flow, data, IT)

# Solution overview

Symbio user

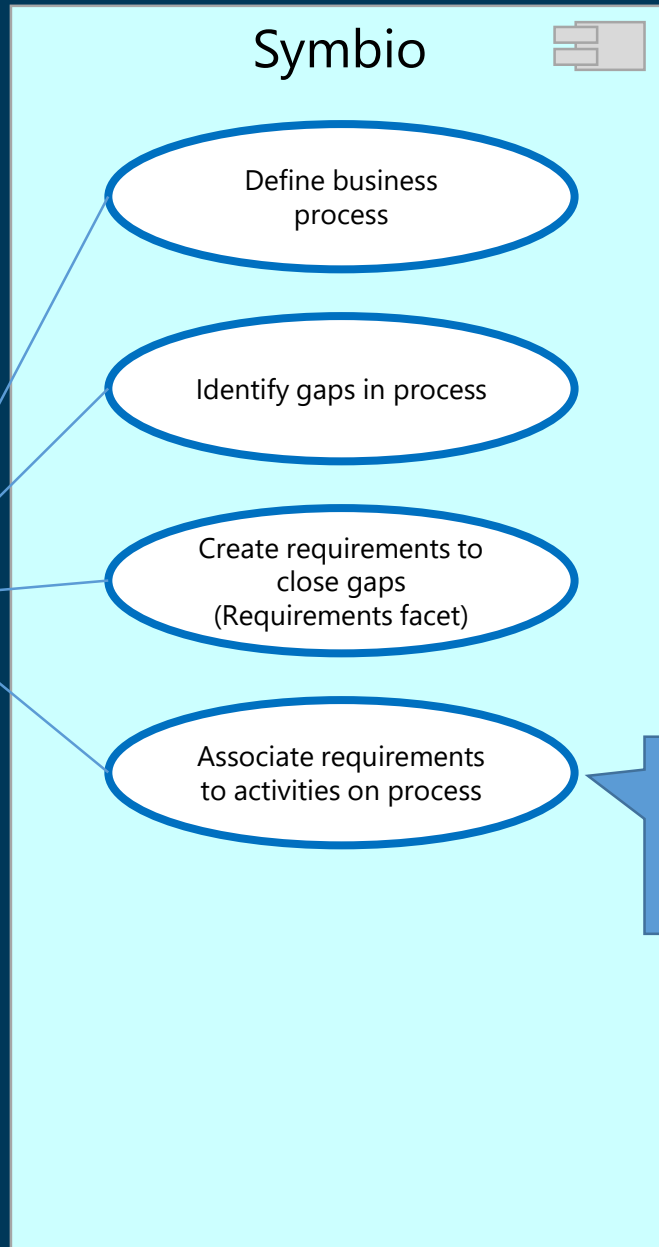

List requirements to close the gaps in the Requirements facet + detail requirements

# Solution overview

Symbio user

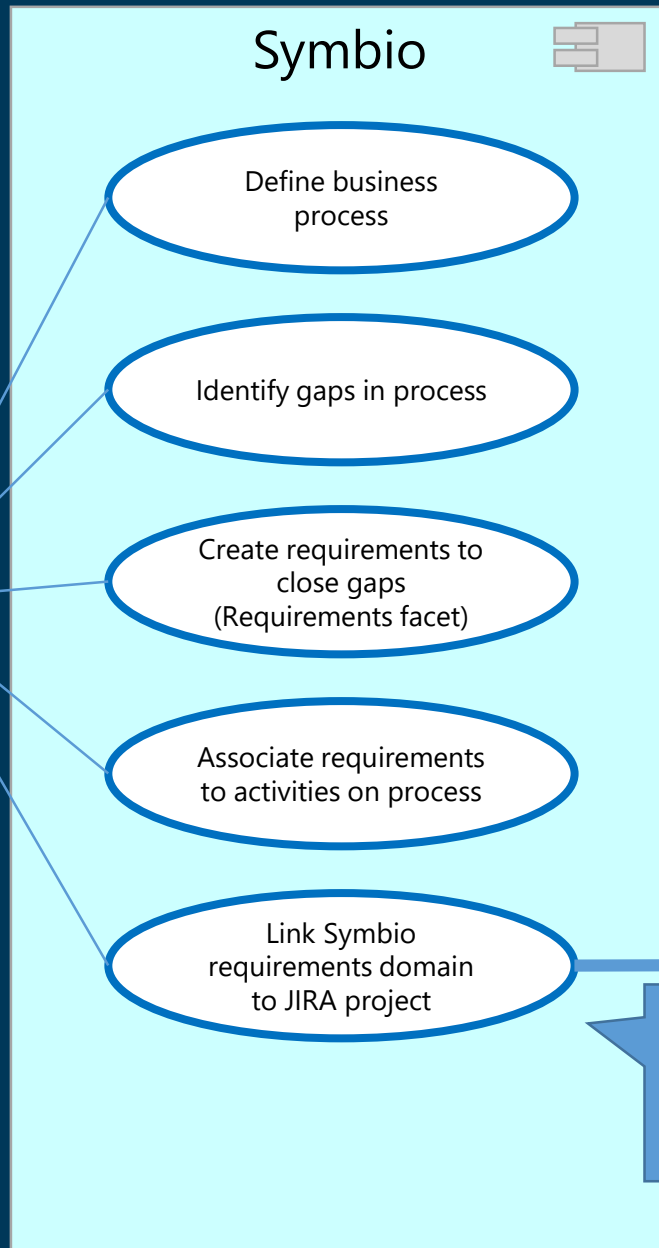

Associate requirements to activities on process

# Solution overview

Symbio user

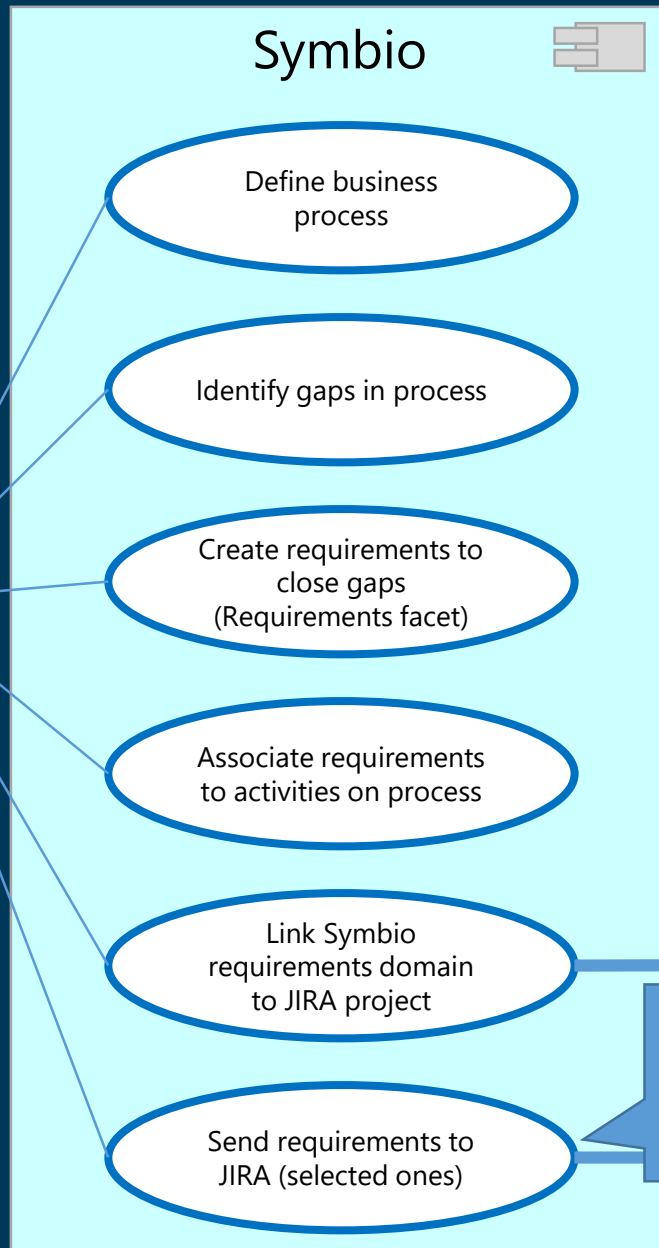

Once linked, all JIRA requirements are then synchronized to Symbio under domain

# Solution overview

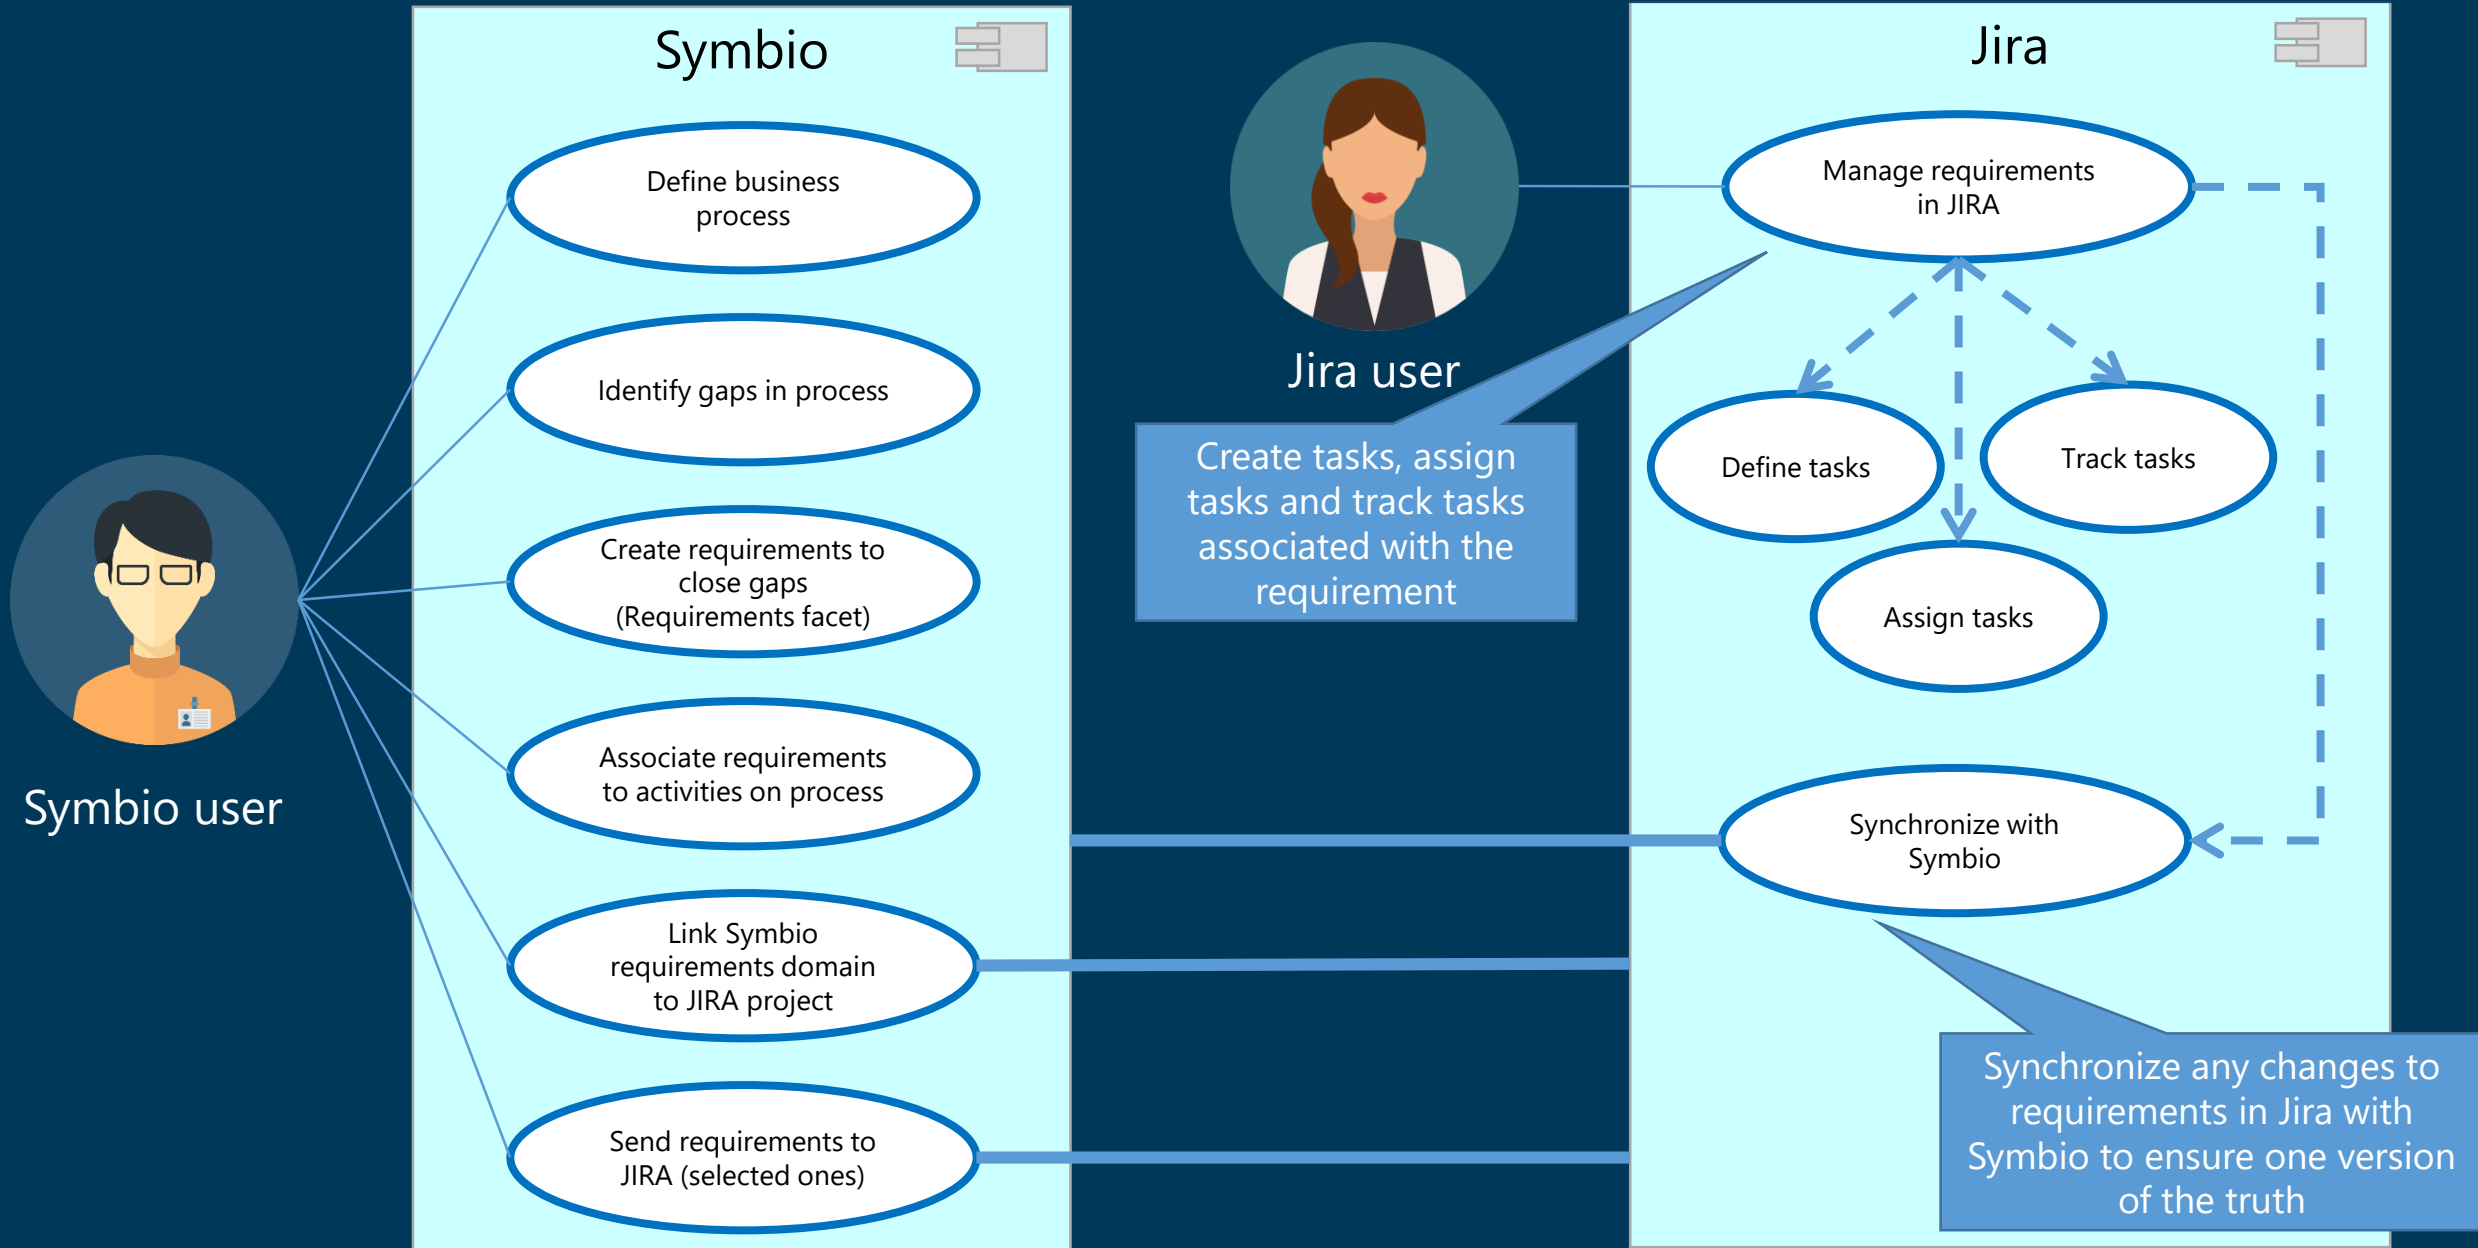

Symbio user

Once requirements are sent, Jira takes ownership of the requirement
