The Symbio-SolMan Integration Service

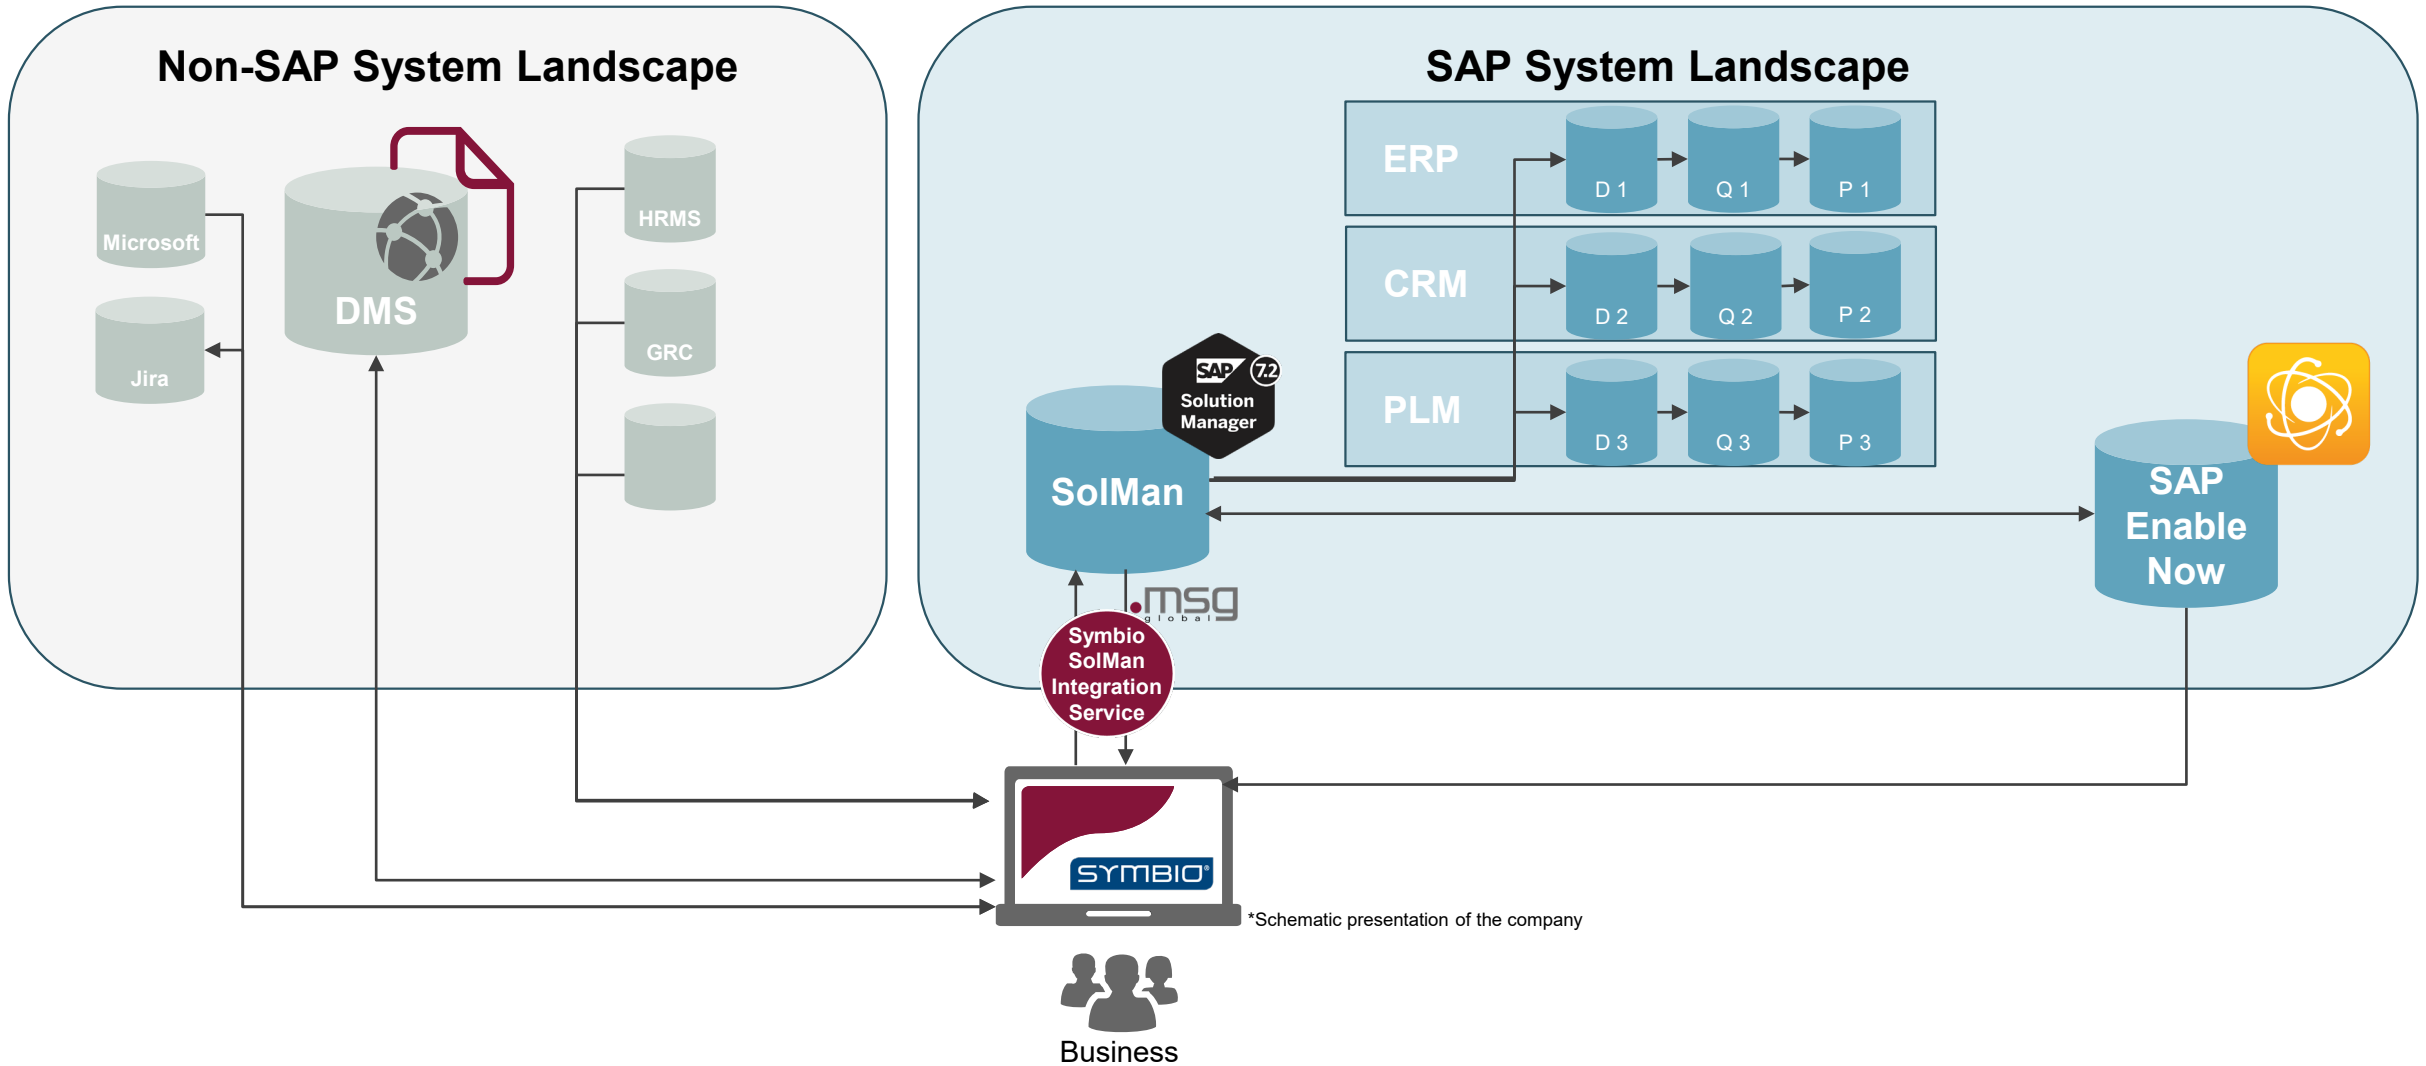

Symbio Innovation Day – Functional Concept

Methodology and Technology

The goal of the Integration Service development was, to combine a methodology with a specific basic tool set, to make a process-oriented Application Lifecycle Management possible.

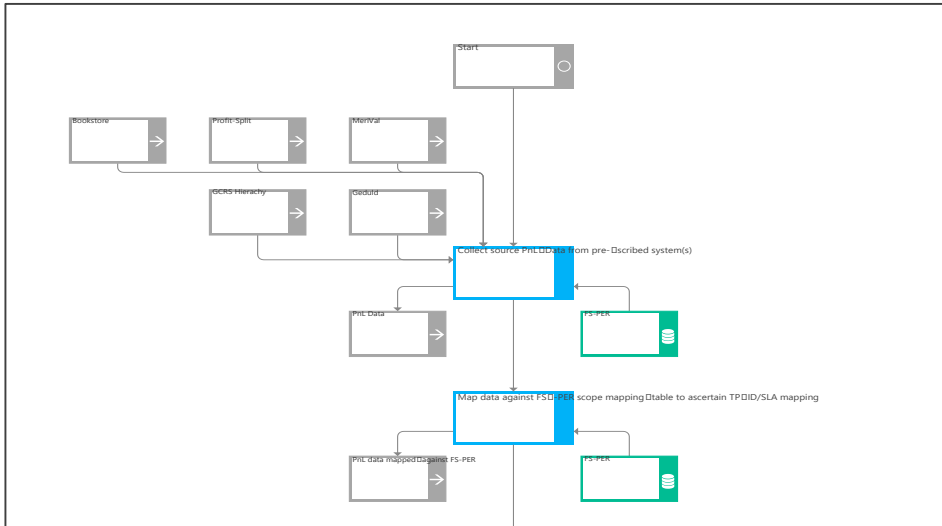

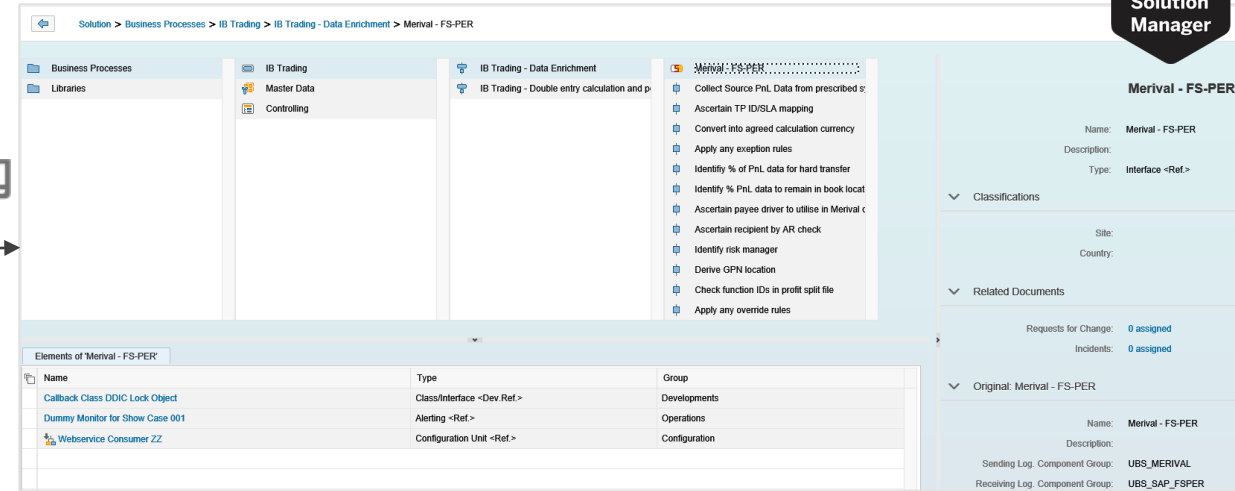

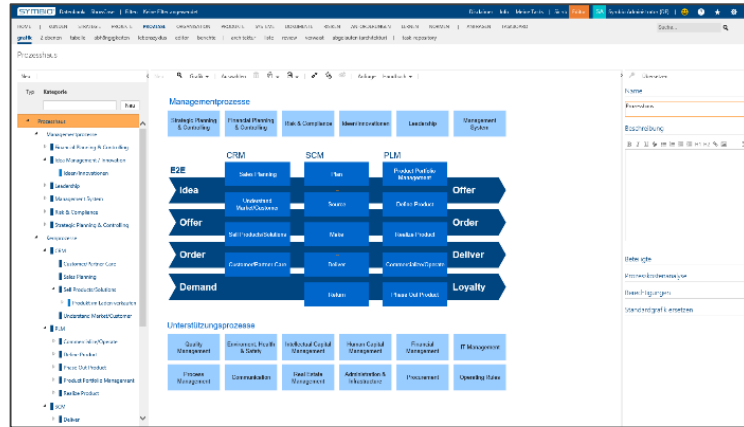

Information management

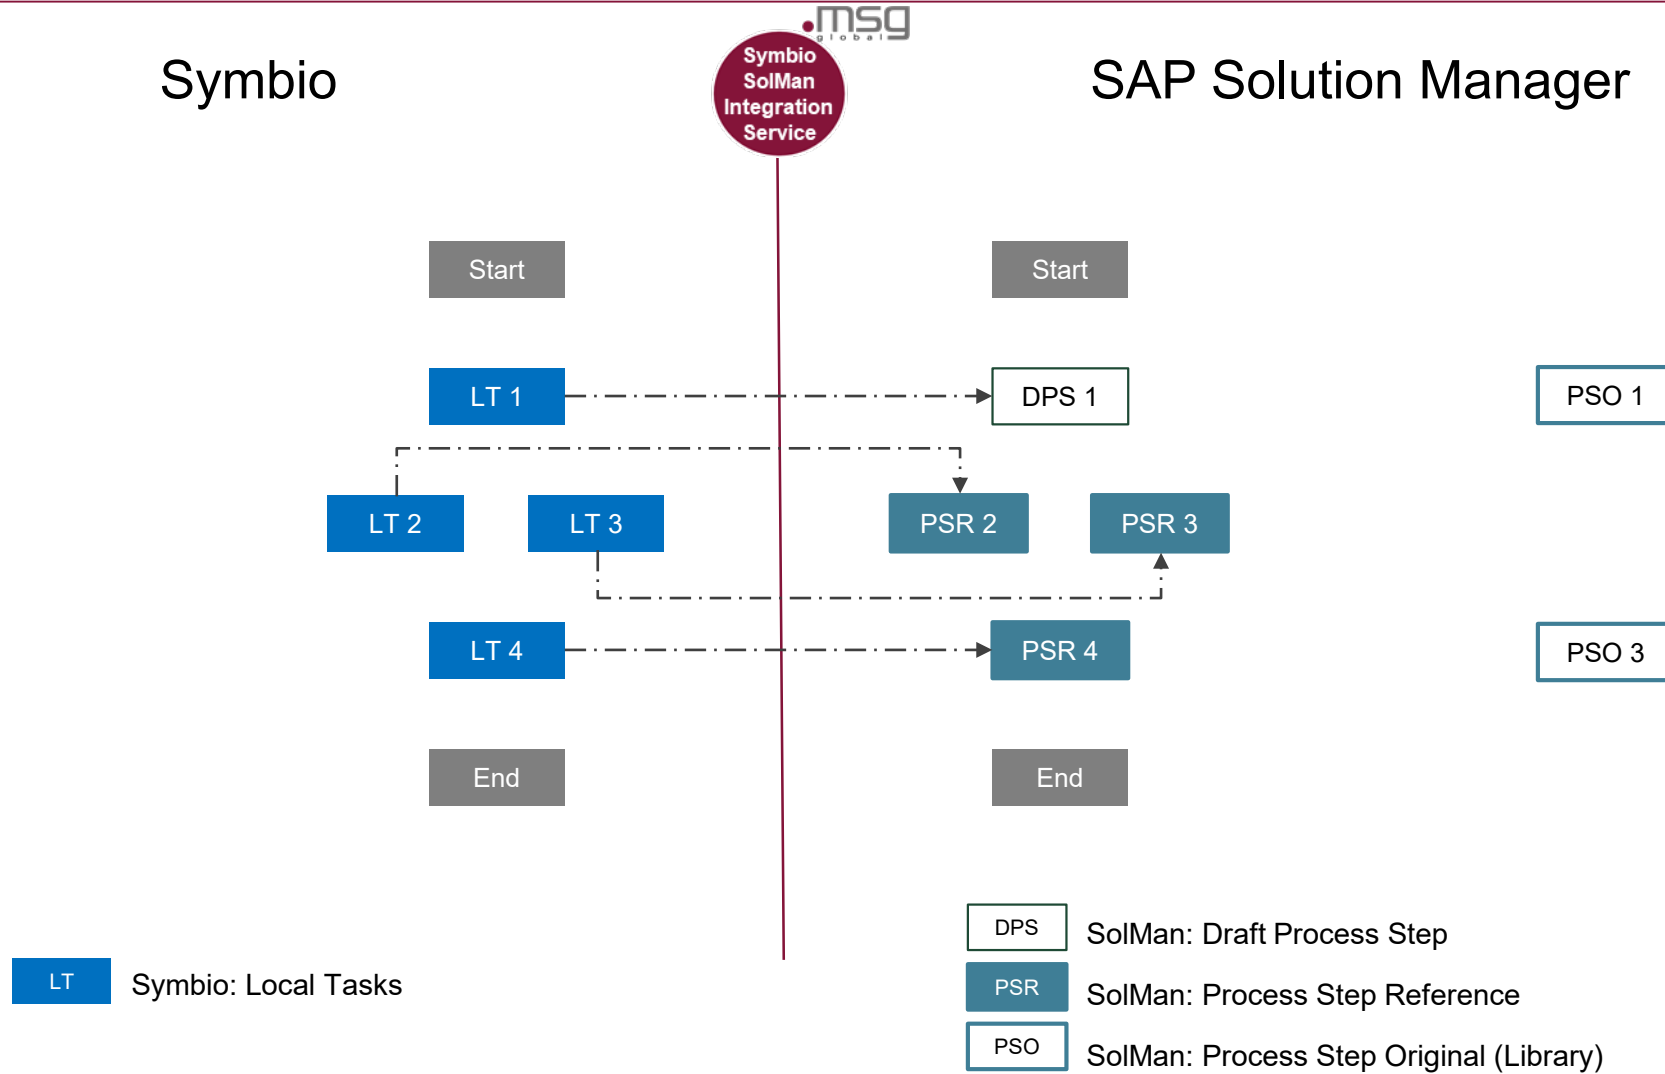

Key Features address customer pain points

- BPM capabilities of SolMan are limited!
-> comprehensive process architecture needs sophisticated BPM platform like Symbio
- Business should not need to access SolMan – but the information provided in SolMan should be available
-> UX friendly environment of Symbio provides all relevant information
- Possibility to reuse preexisting content from SAP Solution Manager in Symbio
-> the new architecture allows Symbio to mirror the SAP Solution Manager content, which allows to reuse existing content from SolMan without losing any logical connections to library objects
- For implementations and HANA transformations the best practice content needs to be available
-> the integration service allows to download and maintain the SAP best practices / model company contents with Symbio
- Customers demand flexibility in tool usage
-> Symbio and SolMan offer standardized integration options for „best of breed“ applications (e.g. ServiceNow, Atlassian Jira or Confluence, ...)

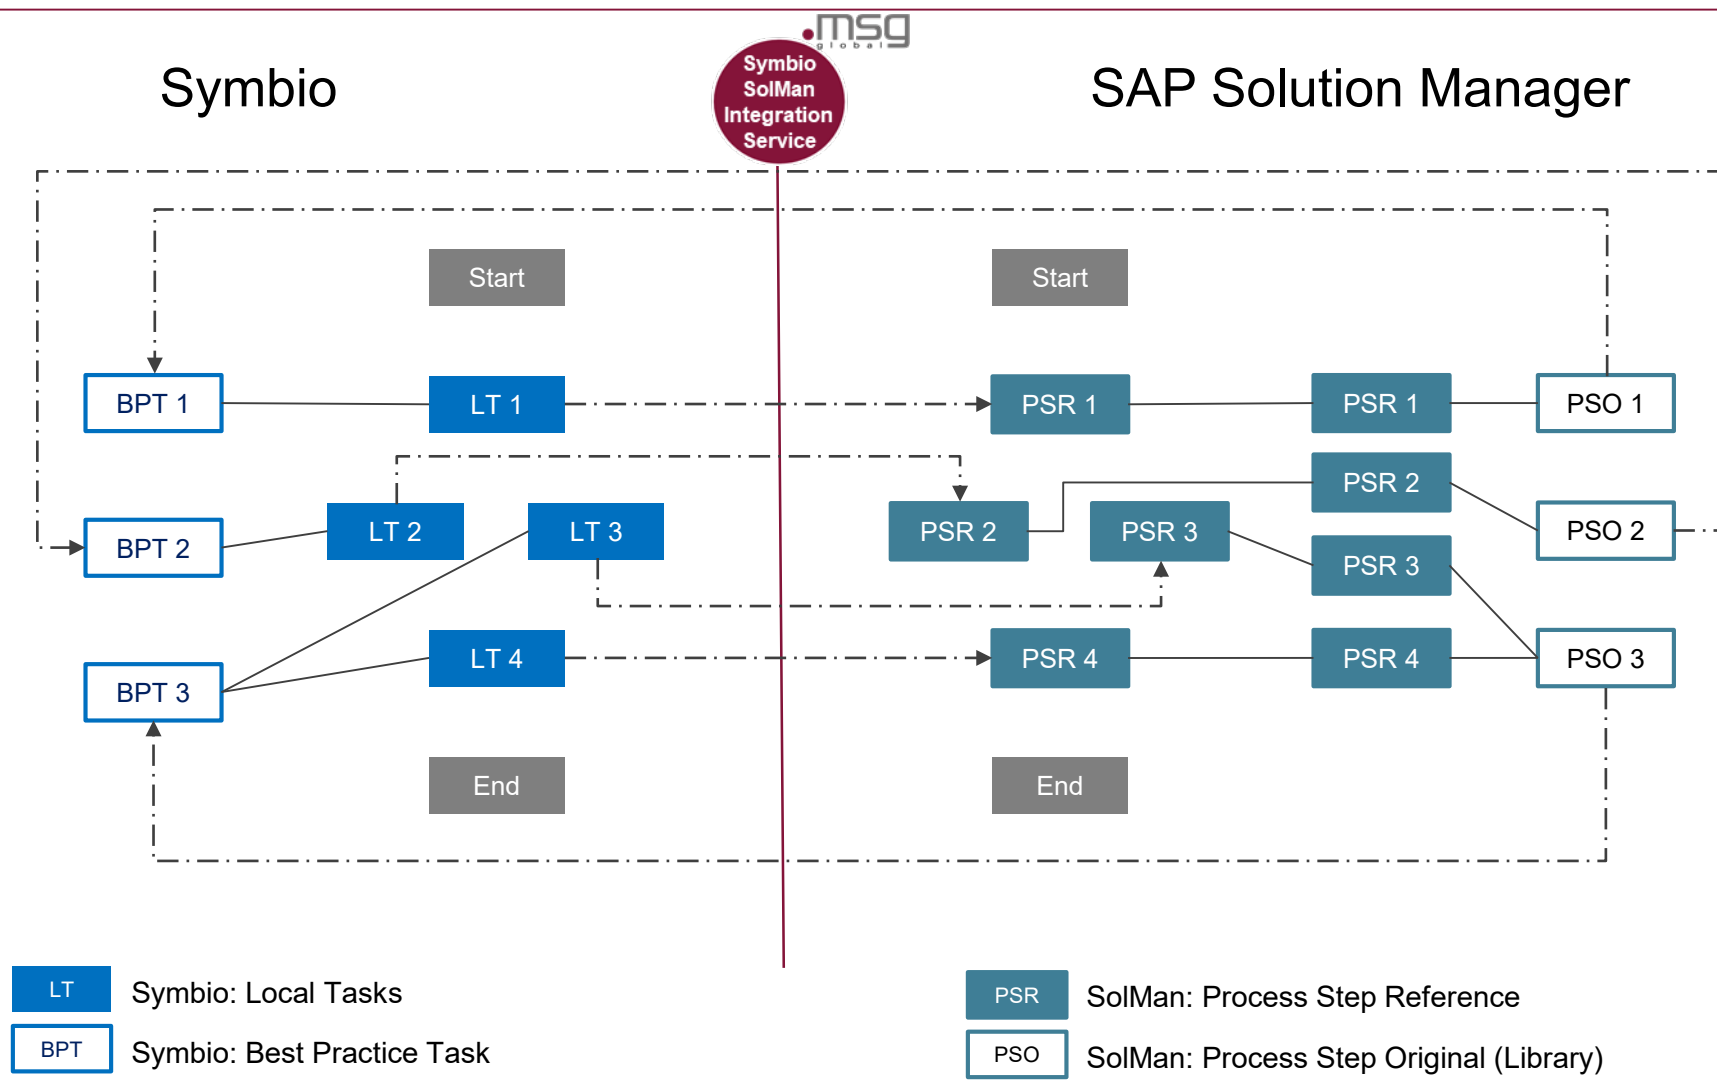

Integration service data mapping for holistic solution design

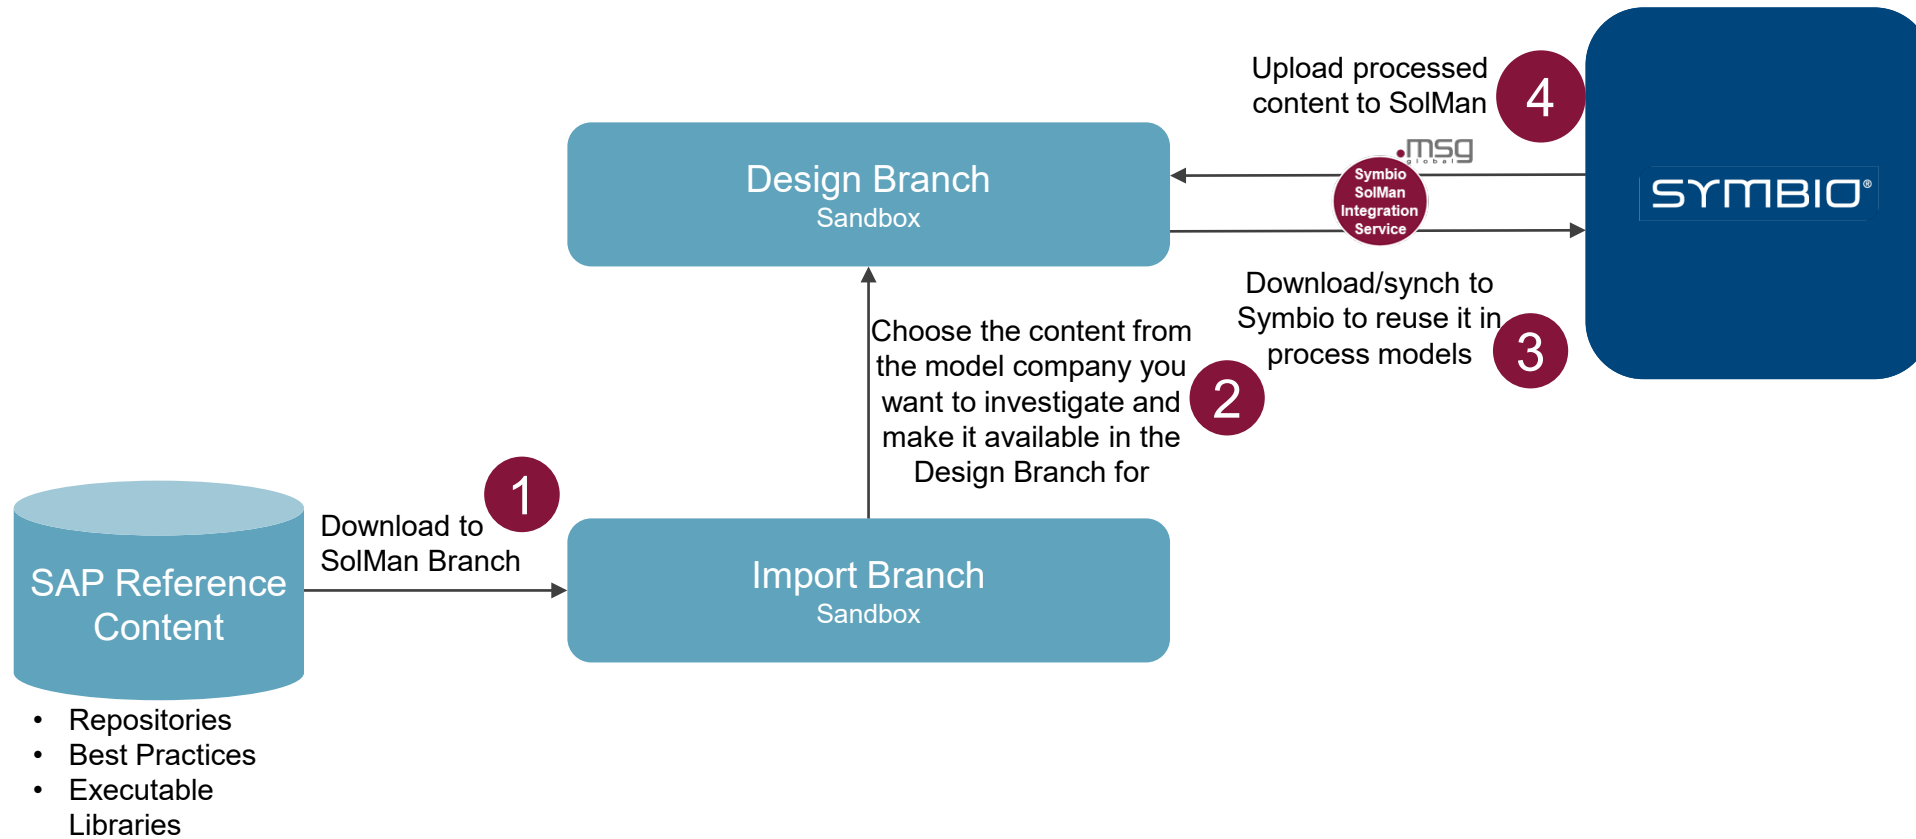

Synchronization Schema – Relations (with Drafts)

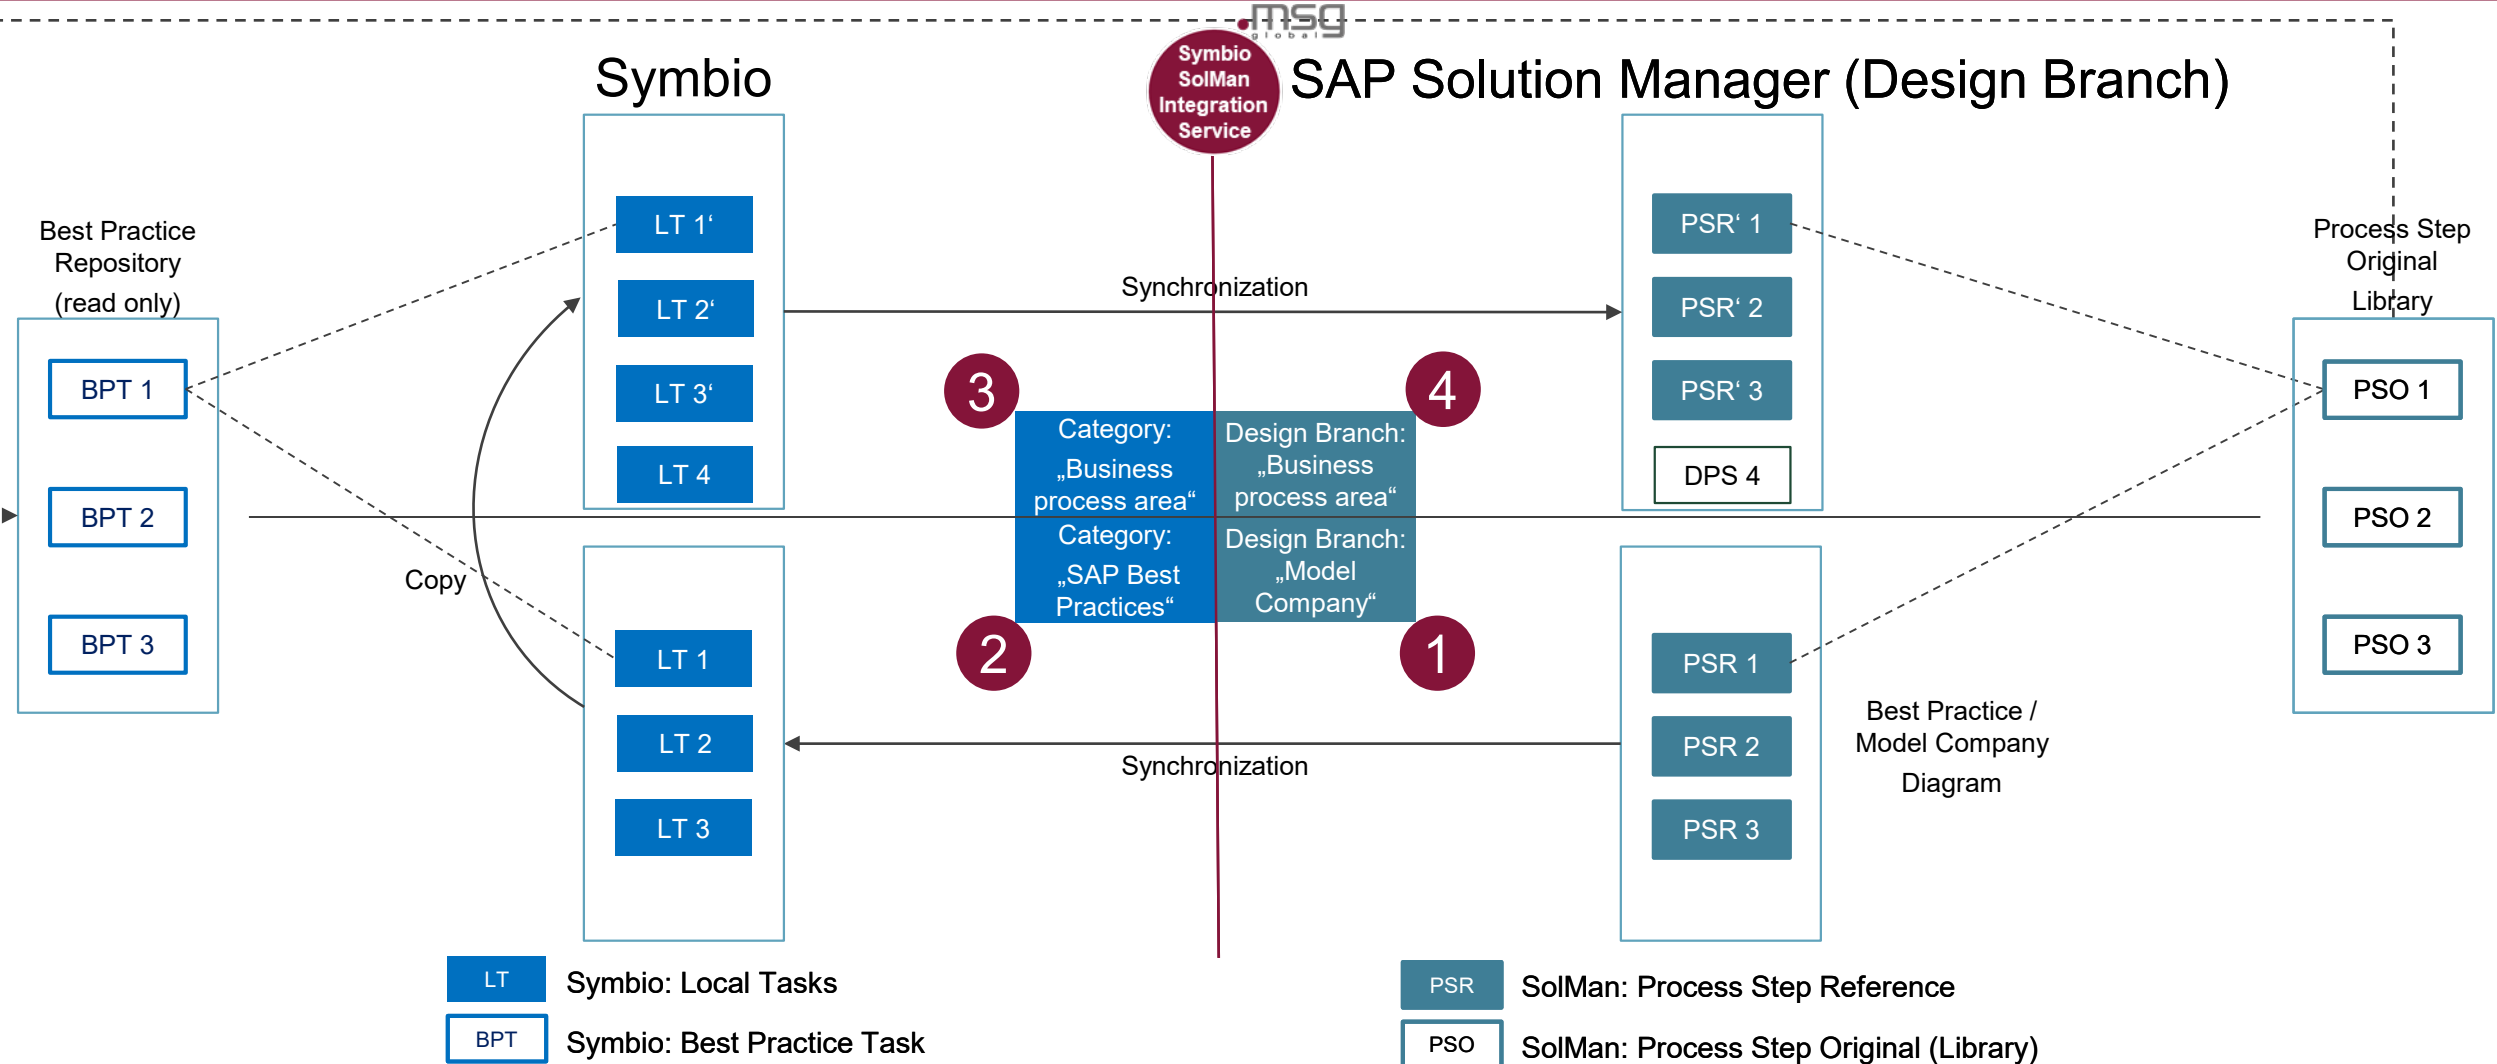

Synchronization Schema – Relations

SAP Reference content usage

Usage of Model Company content - simplified representation

Features to expect in the next releases

- Introduction of BPMN pools (collaboration diagram) to Symbio for model company usage
- Sync of connected executables from SAP SolMan to Symbio (Object in Symbio: Application Services – read only)
- Logical Component (Group) synchronization
- Bi-directional document link synchronization (not physical)
- ...

Gazing into the crystal ball:

- Create requirements in Symbio and transfer to requirement management of SAP Solution Manager
- Create process-oriented test cases in Symbio and synch to SAP test suite
- Create change requests (ChaRM) from Symbio
- Provide test status from SAP Solution Manager to Symbio dashboard
- ...
